Project Plan:

Assignment 3 is created using mongodb, mongoose, ejs templating, express js, all combined together to deploy and use CRUD to display and use the website. In my code the Express.js is using the Node.js to import modules and files like the express and ejs layout. The code and server setup the express application and connect to the "usertrack" database in mongodb which saves the user inputs for the technology inputs. The server uses a view engine and connects to port 3000 where it locally displays the website using localhost:3000. My website is a portal for users to input a technology device they may have. The website asks users to input what type of device they have and also what brand/model it is, and lastly asks them for the year it was purchased in. After the user submits it stores it in mongodb for others and user to access at another time.
